FRW cosmology  
preferred coordinates  
for homogeneous and  
isotropic space

*preferred space+time split in FRW cosmology  
breaks symmetry of Einstein's theory*

# FLRW metric

- ▶ 4D spacetime split into 1+3
- ▶ Friedmann-Lemaitre-Robertson-Walker (FLRW) line element:

$$ds^2 = -c^2 dt^2 + a^2(t) dX^2$$

- ▶ time + homogeneous and isotropic space
- ▶ dynamical scale factor,  $a(t)$ , where  $a_0 = 1$  today
- ▶ maximally-symmetric 3-space, curvature  $K$

$$dX^2 = \frac{dr^2}{1 - Kr^2} + r^2 (d\theta^2 + \sin^2 \theta d\phi^2)$$

- ▶ alternative (conformal) time coordinate,  $d\tau = c dt/a$ :

$$ds^2 = a^2(\tau) [-d\tau^2 + dX^2]$$

# FLRW metric

- ▶ 4D spacetime split into 1+3
- ▶ Friedmann-Lemaitre-Robertson-Walker (FLRW) line element:

$$ds^2 = -c^2 dt^2 + a^2(t) dX^2$$

- ▶ time + homogeneous and isotropic space
- ▶ dynamical scale factor,  $a(t)$ , where  $a_0 = 1$  today
- ▶ maximally-symmetric 3-space, curvature  $K$

$$dX^2 = \frac{dr^2}{1 - Kr^2} + r^2 (d\theta^2 + \sin^2 \theta d\phi^2)$$

- ▶ alternative (conformal) time coordinate,  $d\tau = c dt/a$ :

$$ds^2 = a^2(\tau) [-d\tau^2 + dX^2]$$

- ▶ Henceforth assume  $K = 0$ , flat space

# Scalar perturbations

- ▶ Scalar quantity, e.g., density at fixed point  $P$  is invariant under change of coordinates
- ▶ Split into background (homogeneous) part and a perturbation (inhomogeneous):

$$\rho(t, \vec{x}) = \bar{\rho}(t) + \delta\rho(t, \vec{x})$$

- ▶ expand perturbation order-by-order in a small parameter,  $\varepsilon$ :

$$\delta\rho(t, \vec{x}) = \varepsilon\delta_1\rho(t, \vec{x}) + \frac{1}{2}\varepsilon^2\delta_2\rho(t, \vec{x}) + \dots$$

- ▶ keep only terms at first order in  $\varepsilon \Rightarrow$  *linear perturbations*

$$\delta\rho(t, \vec{x}) = \varepsilon\delta_1\rho(t, \vec{x})$$

# Expanding equations order-by-order

- e.g., non-relativistic continuity equation for density  $\rho(t, \vec{x})$

$$\frac{\partial \rho}{\partial t} + \vec{\nabla} \cdot (\rho \vec{v}) = 0 \quad (1)$$

expand density and velocity order-by-order

$$\rho(t, \vec{x}) = \bar{\rho}(t) + \varepsilon \delta_1 \rho(t, \vec{x}) + \frac{1}{2} \varepsilon^2 \delta_2 \rho(t, \vec{x}) + \dots$$

$$\vec{v}(t, \vec{x}) = \varepsilon \delta_1 \vec{v}(t, \vec{x}) + \frac{1}{2} \varepsilon^2 \delta_2 \vec{v}(t, \vec{x}) + \dots$$

substitute into Eq. (1)

$$\begin{aligned} & \frac{\partial}{\partial t} \left( \bar{\rho} + \varepsilon \delta_1 \rho + \frac{1}{2} \varepsilon^2 \delta_2 \rho + \dots \right) \\ & + \vec{\nabla} \cdot \left[ \left( \bar{\rho} + \varepsilon \delta_1 \rho + \frac{1}{2} \varepsilon^2 \delta_2 \rho + \dots \right) \right. \\ & \quad \left. \times \left( \varepsilon \delta_1 \vec{v} + \frac{1}{2} \varepsilon^2 \delta_2 \vec{v} + \dots \right) \right] = 0 \end{aligned}$$

# Perturbation equations order-by-order

- ▶ collect terms order-by-order in  $\varepsilon$

$$\begin{aligned} & \frac{\partial}{\partial t} \bar{\rho} \\ & + \varepsilon \left\{ \frac{\partial}{\partial t} \delta_1 \rho + \vec{\nabla} \cdot (\bar{\rho} \delta_1 \vec{v}) \right\} \\ & + \frac{1}{2} \varepsilon^2 \left\{ \frac{\partial}{\partial t} \delta_2 \rho + \vec{\nabla} \cdot (\bar{\rho} \delta_2 \vec{v} + 2 \delta_1 \rho \delta_1 \vec{v}) \right\} + \dots = 0 \end{aligned}$$

- ▶ solve order-by-order in  $\varepsilon$

$$\begin{aligned} \frac{\partial}{\partial t} \bar{\rho} &= 0 \quad \Rightarrow \quad \bar{\rho} = C \\ \frac{\partial}{\partial t} \delta_1 \rho + C \vec{\nabla} \cdot \delta_1 \vec{v} &= 0 \\ \frac{\partial}{\partial t} \delta_2 \rho + C \vec{\nabla} \cdot \delta_2 \vec{v} &= -2C \vec{\nabla} \cdot (\delta_1 \rho \delta_1 \vec{v}) \end{aligned}$$

# Fourier transform

- ▶ Field in real space is an integral over Fourier modes:

$$\delta\rho(t, \vec{x}) = \int \frac{d^3k}{(2\pi)^3} \delta\rho_{\vec{k}}(t) e^{i\vec{k}\cdot\vec{x}}$$

- ▶ Fourier modes are eigenfunctions of the spatial Laplacian:

$$\nabla^2 \left( e^{i\vec{k}\cdot\vec{x}} \right) = -k^2 e^{i\vec{k}\cdot\vec{x}}$$

which provide a complete orthonormal basis:

$$\int d^3x e^{i\vec{k}_1\cdot\vec{x}} e^{i\vec{k}_2\cdot\vec{x}} = (2\pi)^3 \delta^{(3)}(\vec{k}_1 - \vec{k}_2)$$

- ▶ Coefficient in Fourier space is integral over real space:

$$\delta\rho_{\vec{k}}(t) = \int d^3x \delta\rho(t, \vec{x}) e^{-i\vec{k}\cdot\vec{x}}$$

# Statistical distribution

- ▶ *theory*  
describes properties of distribution = ensemble,  
assumed isotropic  
( $\langle \dots \rangle$  = average over all possible realisations)
- ▶ *observations*  
describe one realisation from the distribution

# Power spectrum

- ▶ defined by the correlation of two modes in Fourier space:

$$\langle \delta\rho_{\vec{k}_1} \delta\rho_{\vec{k}_2} \rangle = (2\pi)^3 P_\rho(k_1) \delta^3(\vec{k}_1 + \vec{k}_2)$$

*note:*  $P_\rho(k)$  only a function of wavenumber  $k$ , not wavevector  $\vec{k}$ , for an isotropic distribution

- ▶ Variance in real space: (*exercise for reader!*)

$$\begin{aligned} \langle \delta\rho^2(\vec{x}) \rangle &= \left\langle \int \frac{d^3\vec{k}_1 d^3\vec{k}_2}{(2\pi)^6} \delta\rho_{\vec{k}_1} \delta\rho_{\vec{k}_2} e^{i(\vec{k}_1 + \vec{k}_2) \cdot \vec{x}} \right\rangle \\ &= \int \frac{d^3\vec{k}_1 d^3\vec{k}_2}{(2\pi)^6} \langle \delta\rho_{\vec{k}_1} \delta\rho_{\vec{k}_2} \rangle e^{i(\vec{k}_1 + \vec{k}_2) \cdot \vec{x}} \\ &= \int \frac{d^3\vec{k}_1}{(2\pi)^3} P_\rho(k_1) = \int d\ln k_1 \mathcal{P}_\rho(k_1) \end{aligned}$$

- ▶ dimensionless power spectrum per log  $k$ :

$$\mathcal{P}_\rho(k) = \frac{4\pi k^3}{(2\pi)^3} P_\rho(k)$$

## ► Bispectrum

$$\langle \delta\rho_{\vec{k}_1} \delta\rho_{\vec{k}_2} \delta\rho_{\vec{k}_3} \rangle = (2\pi)^3 B_\rho(k_1, k_2, k_3) \delta^3(\vec{k}_1 + \vec{k}_2 + \vec{k}_3)$$

Bispectrum is zero for *Gaussian* perturbations (and for all odd moments)

## ► We will take *first-order* perturbations to be *Gaussian*:

$$\langle \delta_1\rho_{\vec{k}_1} \delta_1\rho_{\vec{k}_2} \delta_1\rho_{\vec{k}_3} \rangle = 0$$

Second- and higher-order perturbations are *non-Gaussian*.

$$\langle \delta_2\rho_{\vec{k}_1} \delta_1\rho_{\vec{k}_2} \delta_1\rho_{\vec{k}_3} \rangle \neq 0$$

fluid equations

# Vector perturbations

- ▶ decompose any 3-vector:  $\vec{V} = \vec{\nabla} V^{(s)} + \vec{V}^{(v)}$ 
  - ▶ *scalar* (longitudinal/potential) flow:  $\vec{\nabla} \times \vec{\nabla} V^{(s)} = 0$
  - ▶ *vector* (transverse/divergence-free) flow:  $\vec{\nabla} \cdot \vec{V}^{(v)} = 0$

- ▶ Fourier transform

- ▶ *scalar*

$$V^{(s)}(t, \vec{x}) = \int \frac{d^3k}{(2\pi)^3} V_{\vec{k}}^{(s)}(t) e^{i\vec{k} \cdot \vec{x}}$$

- ▶ *vector*

$$\vec{V}^{(v)}(t, \vec{x}) = \int \frac{d^3k}{(2\pi)^3} \left\{ V_{\vec{k}}^{(v)}(t) \vec{e}_{\vec{k}} + \tilde{V}_{\vec{k}}^{(v)}(t) \tilde{\vec{e}}_{\vec{k}} \right\} e^{i\vec{k} \cdot \vec{x}}$$

where  $\vec{e}_{\vec{k}}$  and  $\tilde{\vec{e}}_{\vec{k}}$  are orthonormal *polarisation* vectors:

$$\vec{e}_{\vec{k}} \cdot \vec{e}_{\vec{k}} = \tilde{\vec{e}}_{\vec{k}} \cdot \tilde{\vec{e}}_{\vec{k}} = 1, \quad \vec{e}_{\vec{k}} \cdot \tilde{\vec{e}}_{\vec{k}} = 0$$

transverse to wavevector  $\vec{k}$ :

$$\vec{k} \cdot \vec{e}_{\vec{k}} = \vec{k} \cdot \tilde{\vec{e}}_{\vec{k}} = 0$$

# Vector perturbations

putting it all together

$$\vec{V}(t, \vec{x}) = \int \frac{d^3k}{(2\pi)^3} \left\{ i\vec{k} V_{\vec{k}}^{(s)}(t) + \vec{e}_{\vec{k}} V_{\vec{k}}^{(v)}(t) + \vec{\tilde{e}}_{\vec{k}} \tilde{V}_{\vec{k}}^{(v)}(t) \right\} e^{i\vec{k} \cdot \vec{x}}$$

# Tensor perturbations

- ▶ decompose any 3-tensor:

$$T_{ij} = \delta_{ij}C + \nabla_i \nabla_j S + (1/2)(\nabla_i V_j + \nabla_j V_i) + h_{ij}$$

- ▶ *scalars*  $C$  and  $S$  are longitudinal/potential
- ▶ *vector*  $V_i$  is transverse:  $\nabla^i V_i = 0$
- ▶ *tensor*  $h_{ij}$  is transverse and trace-free:

$$\nabla^i h_{ij} = \nabla^j h_{ij} = 0, \quad h^i_i = 0$$

# Tensor perturbations

- Fourier transform:

$$h_{ij}(t, \vec{x}) = \int \frac{d^3k}{(2\pi)^3} \left\{ h_{\vec{k}}^{(+)}(t) q_{\vec{k}ij}^{(+)} + h_{\vec{k}}^{(\times)}(t) q_{\vec{k}ij}^{(\times)} \right\} e^{i\vec{k} \cdot \vec{x}}$$

where *polarisation* tensors

$$q_{\vec{k}ij}^{(+)} = \frac{1}{\sqrt{2}} \left( e_{\vec{k}i} e_{\vec{k}j} - \tilde{e}_{\vec{k}i} \tilde{e}_{\vec{k}j} \right)$$

$$q_{\vec{k}ij}^{(\times)} = \frac{1}{\sqrt{2}} \left( e_{\vec{k}i} \tilde{e}_{\vec{k}j} + \tilde{e}_{\vec{k}i} e_{\vec{k}j} \right)$$

and  $e_{\vec{k}i}$  and  $\tilde{e}_{\vec{k}i}$  are orthonormal, transverse vectors, such that (*exercise for reader!*)

$$q_{\vec{k}}^{(+)}{}^{ij} q_{\vec{k}ij}^{(+)} = q_{\vec{k}}^{(\times)}{}^{ij} q_{\vec{k}ij}^{(\times)} = 1, \quad q_{\vec{k}}^{(+)}{}^{ij} q_{\vec{k}ij}^{(\times)} = 0$$

tracefree  $q_{\vec{k}i}^{(+)}{}^i = q_{\vec{k}i}^{(\times)}{}^i = 0$  and transverse to  $\vec{k}$ :

$$k^i q_{\vec{k}ij}^{(+)} = k^i q_{\vec{k}ij}^{(\times)} = 0$$

# Metric perturbations

- ▶ Split metric into spatially-flat FLRW background and inhomogeneous perturbation:

$$g_{\mu\nu} = \bar{g}_{\mu\nu} + \delta g_{\mu\nu} .$$

- ▶ Background:

$$\bar{g}_{00} = a^2, \quad \bar{g}_{0i} = 0, \quad \bar{g}_{ij} = a^2 \delta_{ij} \quad (2)$$

- ▶ Perturbation:

$$\delta g_{00} = 2a^2 A$$

$$\delta g_{0i} = a^2 (\nabla_i B - S_i)$$

$$\delta g_{ij} = a^2 (2C \delta_{ij} + 2\nabla_i \nabla_j E + \nabla_i F_j + \nabla_j F_i + h_{ij})$$

- ▶ 4 scalars:  $A, B, C, E$
- ▶ 2 vectors:  $S_i, F_i$
- ▶ 1 tensor:  $h_{ij}$

- ▶ Perturbed line-element including only scalar perturbations:

$$\begin{aligned} ds^2 &= g_{\mu\nu} dx^\mu dx^\nu \\ &= a^2(\tau) \left\{ -(1 + 2A)d\tau^2 + 2(\partial_i B)dx^i d\tau \right. \\ &\quad \left. + [(1 + 2C)\delta_{ij} + 2(\partial_{ij} E)] dx^i dx^j \right\} \end{aligned}$$

where four scalar perturbations are

- ▶  $A$  = lapse perturbation
- ▶  $\partial_i B = \partial B / \partial x^i$  = shift perturbation
- ▶  $C$  = spatial curvature perturbation
- ▶  $\partial_{ij} E = \partial^2 E / \partial x^i \partial x^j$  = off-diagonal spatial perturbation

# Geometrical interpretation

- ▶ Temporal gauge (time-slicing) in 4D spacetime defines a hypersurface orthogonal 4-vector field:

$$N_\mu \propto \frac{\partial \tau}{\partial x^\mu}$$

normalise such that  $N_\mu N^\mu = -1$ .

- ▶ intrinsic curvature of constant  $\tau$  hypersurfaces:

$${}^{(3)}R = -\frac{4}{a^2} \nabla^2 C$$

- ▶ expansion of constant  $\tau$  hypersurfaces:

$$\theta = \frac{3}{a} \left( \frac{a'}{a} (1 - A) + C' + \frac{1}{3} \nabla^2 \sigma \right)$$

- ▶ shear:

$$\sigma_{ij} = \left( \nabla_i \nabla_j - \frac{1}{3} \nabla^2 \right) \sigma, \quad \sigma = E' - B$$

- ▶ acceleration:

$$a_i = \nabla_i A$$

FRW cosmology  
preferred coordinates

isotropic space

*preferred space+time split in FRW cosmology  
breaks symmetry of Einstein's theory*

FRW cosmology

*no unique choice of time (slicing) and space coordinates (threading)  
in an inhomogeneous universe*

FRW cosmology  
+ perturbations

arbitrary gauge  $(t,x)$

*gauge problem: find different perturbations in different gauges*

# Gauge dependence

- ▶ Scalar quantity, e.g., density,  $\rho|_P$ , at given point  $P$  is invariant

$$\rho(\tau, \vec{x})|_P = \tilde{\rho}(\tilde{\tau}, \tilde{\vec{x}})|_P$$

under first-order (scalar) change of coordinates:

$$\begin{aligned}\tilde{\tau} &= \tau + \delta\tau(\tau, \vec{x}) \\ \tilde{\vec{x}} &= \vec{x} + \vec{\nabla}\delta\chi(\tau, \vec{x})\end{aligned}$$

- ▶ but background-perturbation split is gauge-dependent

$$\begin{aligned}\rho_0(\tau) + \delta\rho|_P &= \rho_0(\tilde{\tau}) + \tilde{\delta}\rho|_P \\ \Rightarrow \tilde{\delta}\rho|_P &= \delta\rho|_P + \rho_0(\tau) - \rho_0(\tilde{\tau}) \\ &= \delta\rho|_P - \rho'_0\delta\tau\end{aligned}\tag{3}$$

# Standard Newtonian+Gaussian initial fields

Gaussian primordial metric fluctuations  $\zeta(x)$  from inflation + linear Einstein-Boltzmann code (e.g., CMBfast, CAMB, CLASS)

Gaussian initial Newtonian potential  $\Phi = (3/5)\zeta$

Gaussian initial matter density using Poisson equation

$$\nabla^2 \Phi = 4\pi G a^2 \bar{\rho} \delta$$

Gaussian initial displacement  $\vec{\nabla} \cdot \vec{\Psi} = -\delta$

Newtonian N-body simulations

$$\nabla^2 \Phi = 4\pi G a^2 \bar{\rho} \delta$$

$$\dot{\delta} + \vec{\nabla} \cdot ((1 + \delta)) \vec{v} = 0$$

$$\dot{\vec{v}} + \mathcal{H} \vec{v} + (\vec{v} \cdot \vec{\nabla}) \vec{v} = -\vec{\nabla} \Phi$$

# Uniform-density gauge

▶ pick a gauge to completely fix the coordinates

▶ for example: *uniform-density time-slices*:

- ▶ set  $\delta\rho \rightarrow \widetilde{\delta\rho} = 0$  which requires a transform  $\delta\tau = \delta\rho/\rho'$
- ▶ we then have

$$\text{density: } \delta\rho \rightarrow \widetilde{\delta\rho} = 0$$

$$\text{pressure: } \delta P \rightarrow \widetilde{\delta P} = \delta P_{\text{nad}} \equiv \delta P - c_s^2 \delta\rho \quad (8)$$

where  $c_s^2 = P'/\rho' =$  adiabatic sound speed.

▶ *gauge-invariant metric perturbation*:

$$\text{curvature: } C \rightarrow \zeta \equiv C - \frac{a'}{a} \frac{\delta\rho}{\rho'}$$

▶ more generally, for any fluid with density  $\rho_\alpha(\tau, \vec{x})$  we can identify the curvature perturbation on uniform- $\alpha$ -density time-slices:

$$\zeta_\alpha \equiv C - \frac{a'}{a} \frac{\delta\rho_\alpha}{\rho'_\alpha}$$

# Equating gauge-invariant variables

- ▶ Gauge-invariant variables are not unique, and they are not independent
- ▶ for example, the curvature on uniform-density time-slices can be written in terms of the longitudinal gauge metric potential and density contrast:

$$\zeta_\alpha \equiv \Phi + \frac{1}{3(1 + w_\alpha)} \delta_\alpha$$

for example, for radiation and non-relativistic matter:

$$\begin{aligned}\zeta_\gamma &\equiv \Phi + \frac{1}{4} \delta_\gamma \\ \zeta_m &\equiv \Phi + \frac{1}{3} \delta_m\end{aligned}\tag{9}$$

- ▶ Primordial plasma (e.g., at epoch of primordial nucleosynthesis when  $T \approx 1$  MeV)
  - ▶ photons, baryons, neutrinos, cold dark matter + dark energy?
  - ▶ total curvature/dimensionless density perturbation:

$$\zeta = \sum_{\alpha} \frac{1 + w_{\alpha}}{1 + w} \zeta_{\alpha}$$

*conserved on large scales for adiabatic perturbations*

- ▶ isocurvature/relative entropy perturbation:

$$S_{\alpha} = 3(\zeta_{\alpha} - \zeta_{\gamma})$$

- ▶ for example, matter-isocurvature perturbation:

$$S_m = 3(\zeta_m - \zeta_{\gamma}) = \frac{\delta\rho_m}{\rho_m} - \frac{3}{4} \frac{\delta\rho_{\gamma}}{\rho_{\gamma}}$$

*conserved on large scales*

# Cosmological perturbations on large scales

- **adiabatic perturbations**

e.g., 
$$\delta \left( \frac{n_\gamma}{n_B} \right) \propto \frac{\delta n_\gamma}{n_\gamma} - \frac{\delta n_B}{n_B} = 0$$

- *perturb along the background trajectory*

$$\frac{\delta x}{\dot{x}} = \frac{\delta y}{\dot{y}} = \delta T$$

- *e.g., single-field perturbations along slow-roll attractor*
- *adiabatic perturbations stay adiabatic*

- **entropy perturbations**

- *perturb off the background trajectory*

$$\frac{\delta x}{\dot{x}} \neq \frac{\delta y}{\dot{y}}$$

- *e.g., baryon-photon **isocurvature** perturbation:*

# Conserved cosmological perturbations

Lyth & Wands 2003

For every quantity,  $x$ , that obeys a **local conservation equation**

$$\frac{dx}{dN} = y(x) \quad , \quad e.g. \quad \dot{\rho}_m = -3H\rho_m$$

where  $dN = Hdt$  is the locally-defined expansion along comoving worldlines

there is a **conserved perturbation**

$$\zeta_x \equiv \delta N = \frac{\delta x}{y(x)}$$

where perturbation  $\delta x = x_A - x_B$  is evaluated on hypersurfaces separated by uniform expansion  $\Delta N = \Delta \ln a$

# examples:

(i) total energy conservation:  $\frac{d\rho}{dN} = H^{-1} \dot{\rho} = -3(\rho + P)$

for perfect fluid / adiabatic perturbations,  $P=P(\rho)$

$$\Rightarrow \zeta_{\rho} = \frac{\delta\rho}{3(\rho + P)} \quad \text{conserved}$$

(ii) energy conservation for non-interacting perfect fluids:

$$H^{-1} \dot{\rho}_i = -3(\rho_i + P_i) \quad \text{where } P_i = P_i(\rho_i) \quad \Rightarrow \quad \zeta_i = \frac{\delta\rho_i}{3(\rho_i + P_i)}$$

(iii) conserved particle/quantum numbers (e.g., B, B-L, ...)

$$H^{-1} \dot{n}_i = -3n_i \quad \Rightarrow \quad \zeta_i = \frac{\delta n_i}{3n_i}$$

# microwave background signatures:

$$C_l = A^2 \times$$

adiabatic

$$+ B^2 \times$$

CDM isocurvature

$$+ 2 A B \cos\Delta \times$$

correlation

Bucher, Moodley & Turok '00 }  $n_s = 1$   
 Trota, Riazuelo & Durrer '01

Amendola, Gordon, Wands & Sasaki '01

best-fit to Boomerang, Maxima & DAS1

$$B/A = 0.3, \cos\Delta = +1, n_s = 0.8$$

$$\omega_b = 0.02, \omega_{\text{cdm}} = 0.1, \Omega_\Lambda = 0.7$$

# Einstein equations in an arbitrary gauge

## Evolution equations

trace and trace-free spatial part of Einstein equations:

$$C'' + 2\mathcal{H}C' - \mathcal{H}A' - (2\mathcal{H}' + \mathcal{H}^2)A = -4\pi G a^2 \left( \delta P + \frac{2}{3} \nabla^2 \Pi \right),$$

$$\sigma' + 2\mathcal{H}\sigma - A - C = 8\pi G a^2 \Pi,$$

## Energy+momentum constraints

time-time and time-space components:

$$3\mathcal{H}(C' - \mathcal{H}A) - \nabla^2(C - \mathcal{H}\sigma) = 4\pi G a^2 \delta\rho,$$

$$C' - \mathcal{H}A = 4\pi G a^2 (\rho + P)(v + B).$$

## Energy+momentum conservation

Fluid continuity and Euler equations:

$$\delta\rho' + 3\mathcal{H}(\delta\rho + \delta P) + 3(\rho + P)C' + (\rho + P)\nabla^2(v + E') = 0,$$

$$(v + B)' + (1 - 3c_s^2)\mathcal{H}(v + B) + A + \frac{1}{\rho + P} \left( \delta P + \frac{2}{3} \nabla^2 \Pi \right) = 0.$$

# Constraint equations in conformal Newtonian gauge

$$A = \Psi, \quad B = 0, \quad C = \Phi, \quad E = 0$$

Energy and momentum constraint equations

$$\begin{aligned} 3\mathcal{H}(\Phi' - \mathcal{H}\Psi) - \nabla^2\Phi &= 4\pi G a^2 \delta\rho, \\ \Phi' - \mathcal{H}\Psi &= -4\pi G a^2 (\rho + P)V. \end{aligned}$$

eliminate  $\Phi' - \mathcal{H}\Psi$  gives *Poisson equation*:

$$\frac{\nabla^2}{a^2}\Phi = -4\pi G \delta\rho_c,$$

where gauge-invariant *comoving energy density* (i.e.,  $\delta\rho$  in  $v + B = 0$  gauge)

$$\delta\rho_c \equiv \delta\rho + 3\mathcal{H}(\rho + P)V$$

# Fluid equations in arbitrary gauge

Fluid continuity and Euler equations:

$$\begin{aligned} \delta\rho' + 3\mathcal{H}(\delta\rho + \delta P) + 3(\rho + P)C' + (\rho + P)\nabla^2(v + E') &= 0, \\ (v + B)' + (1 - 3c_s^2)\mathcal{H}(v + B) + A + \frac{1}{\rho + P} \left( \delta P + \frac{2}{3}\nabla^2\Pi \right) &= 0. \end{aligned}$$

For zero pressure perturbations (e.g.,  $\Lambda$ CDM)

$$\begin{aligned} \delta\rho' + 3\mathcal{H}\delta\rho + 3\rho C' + \rho\nabla^2(v + E') &= 0, \\ (v + B)' + \mathcal{H}(v + B) + A &= 0. \end{aligned}$$

In comoving gauge ( $v + B = 0$ )

$$\begin{aligned} \delta\rho'_c + 3\mathcal{H}\delta\rho_c + 3\rho C'_c + \rho\nabla^2 V &= 0, \\ A_c &= 0. \end{aligned}$$

and momentum constraint then reduces to  $C'_c = 0$ .

In conformal Newtonian gauge ( $E = B = 0$ ) Euler equation becomes

$$V' + \mathcal{H}V + \Psi = 0.$$

# Recovering Newtonian fluid equations

Changing to density contrast

$$\delta \equiv \frac{\delta\rho}{\rho}$$

we then have for pressureless matter

- ▶ Poisson equation for conformal Newtonian potential:

$$\nabla^2\Phi = -\frac{3}{2}\mathcal{H}^2\delta_c$$

- ▶ Continuity equation for comoving density:

$$\delta'_c + \nabla^2 V = 0$$

- ▶ Euler equation for conformal Newtonian velocity ( $\vec{V} = \vec{\nabla}V$ ):

$$\vec{V}' + \mathcal{H}\vec{V} = -\vec{\nabla}\Psi$$

Coincide exactly to first-order Newtonian perturbation equations in an expanding cosmology, using  $\Psi = -\Phi$  for zero anisotropic stress.

Continuity equation for comoving density contrast:

$$\delta'_c + \nabla^2 V = 0$$

divergence of peculiar velocities,  $\theta \equiv \nabla^2 V$ , seen in galaxy redshift surveys

$$\langle \theta^2 \rangle = f^2 \langle \delta_c^2 \rangle$$

Important probe of growth of structure given by  $f\sigma_8$ , where  $\sigma_8^2$  is the variance of the matter power spectrum on 8 Mpc scales ( $\approx 1$ ).

## Second-order equation for $\delta$

Continuity equation for comoving density contrast:

$$\delta'_c + \nabla^2 V = 0$$

Taking time derivative

$$\delta''_c + \nabla^2 V' = 0$$

plus Euler equation

$$V' + \mathcal{H}V = -\Psi$$

eliminating  $V'$  and  $V$  gives

$$\delta''_c + \mathcal{H}\delta'_c - \nabla^2 \Psi = 0$$

Using  $\Psi = -\Phi$  and Poisson equation

$$\nabla^2 \Phi = -\frac{3}{2}\mathcal{H}^2\delta_c$$

gives linear second-order differential equation

$$\delta''_c + \mathcal{H}\delta'_c - \frac{3}{2}\mathcal{H}^2\delta_c = 0$$

# Growth of structure

In absence of any pressure perturbations, e.g.,  $\Lambda$ CDM

$$\delta_c'' + \mathcal{H}\delta_c' - \frac{3}{2}\mathcal{H}^2\delta_c = 0$$

Growth of structure is independent of scale in  $\Lambda$ CDM cosmology.

$$\delta_k(\tau) = D_+(\tau)\delta_{k,0} + D_-(\tau)\tilde{\delta}_{k,0}$$

- ▶ Growing mode  $D_+(\tau)$  normalised so that  $D_+(\tau_0) = 1$  today
- ▶ Decaying mode  $D_-(\tau)$  assumed negligible at late times
- ▶ In matter-dominated cosmology ( $\Omega_m = 1$ ) then  $D_+ \propto a$

$$f \equiv \frac{d \ln D_+}{d \ln a} = 1$$

- ▶ In  $\Lambda$ CDM

$$f \simeq \Omega_m^{6/11}$$
